

Lab 11 – System/Log monitoring commands and System Information/Maintenance Commands**top**

- The top command has been around a long time and is very useful for viewing details of running processes and quickly identifying issues such as memory hogs. Its default view is shown below.

cbkpc@ubuntulinux~\$ top

F1Help F2Setup F3Search F4Filter F5Tree F6SortBy F7Nice -F8Nice +F9Kill F10Quit

```

df

- The **df** command (short for disk free), is used to display information related to file systems about total space and available space.
- **Syntax :** df [OPTION]... [FILE]...
- If no file name is given, it displays the space available on all currently mounted file systems.

Example 1: cbkpc@ubuntulinux~\$ df

Portion of output:

```

Filesystem    1K-blocks    Used Available Use% Mounted on
udev          3996816      0 3996816 0% /dev
tmpfs         804624    10020  794604 2% /run
/dev/sda9     68117056 18036160 46597712 28% /

```

Example 2: specify particular file, then it will show mount information of that particular file.

For example: cbkpc@ubuntulinux~\$ df /home/cbkpc/test/test.cpp

Output:

```

Filesystem    1K-blocks    Used Available Use% Mounted on
/dev/sda10    78873504 67528220 7315640 91% /home

```

iostat

- The **iostat** command in Linux is used for monitoring system input/output statistics for devices and partitions.
- **Note:** iostat is being included in sysstat package. If user doesn't have it, user need to install first. (apt-get install sysstat)
- **Syntax:** **iostat**
- **Options used:**
 - **-x:** This command shows more details statistics information.
 - **-c:** This command show only the CPU statistic.
 - **-d:** This command displays only the device report

• Example: **cbkpc@ubuntulinux~\$ iostat -x**

```
Linux 5.19.0-43-generic (ubuntu) 05/06/23      _x86_64_      (1 CPU)
avg-cpu: %user %nice %system %iowait %steal %idle
           5.87  0.43  1.94 13.39  0.00 78.37
Device      tps kB_read/s kB_wrtn/s kB_dscd/s kB_read kB_wrtn kB_dscd
loop0        0.00   0.00   0.00   0.00    17     0     0
loop1        0.01   0.08   0.00   0.00   349     0     0
loop10       0.01   0.08   0.00   0.00   350     0     0
loop11       0.08   1.47   0.00   0.00  6764     0     0
```

free

- **free** command is used to view memory consumption
- **cbkpc@ubuntulinux~\$ free -m**

```
              total    used    free   shared  buffers   cached
Mem:          7976    6459    1517      0     865    2248
-/+ buffers/cache:    3344    4631
Swap:         1951       0    1951
```

- The **m** option displays all data in MBs.

cat /proc/cpuinfo

- The file **/proc/cpuinfo** displays what type of processor the user system is running including the number of CPUs present.
- **cbkpc@ubuntulinux~\$ cat /proc/cpuinfo**

```
processor      0
vendor_id     : GenuineIntel
cpu family    6
model         45
model name    : Intel(R) Xeon(R) CPU E5-2660 0 @ 2.20GHz
stepping      6
```

```

microcode      1561
cpu MHz        : 600.000
cache size     : 20480 KB

```

cat /proc/meminfo

- On Linux, user can use the command `cat /proc/meminfo` to **determine how much memory the computer has.**

• **cbkpc@ubuntulinux~\$ cat /proc/meminfo**

```

MemTotal: 8167848 kB
MemFree:   1409696 kB
Buffers:   961452 kB
Cached:    2347236 kB
SwapCached:      0 kB
SwapTotal: 1998844 kB
SwapFree:   1998844 kB
...

```

Work on log directory:

/var/log

- It is essential that user know where the log files are located, and what is contained in them. Such files are usually in **/var/log**. Logging is controlled by the associated **.conf** file.

▮ **cbkpc@ubuntu:~\$ ls /var/log**

```

alternatives.log  cups          kern.log.1
alternatives.log.1 dist-upgrade  kern.log.2.gz
apport.log        dmesg         lastlog
apport.log.1      dmesg.0       openvpn
apport.log.2.gz   dmesg.1.gz    private
apt              dmesg.2.gz    speech-dispatcher
auth.log          dmesg.3.gz    syslog
auth.log.1        dmesg.4.gz    syslog.1
auth.log.2.gz     dpkg.log      syslog.2.gz

```

Few log files:

- /var/log/messages** – Contains global system messages, including the messages that are logged during system startup. There are several things that are logged in `/var/log/messages` including mail, cron, daemon, kern, auth, etc.
- /var/log/auth.log** – Contains system authorization information, including user logins and authentication machinsm that were used.
- /var/log/boot.log** – Contains information that are logged when the system boots
- /var/log/lastlog** – Displays the recent login information for all the users. This is not an

ascii file. User should use lastlog command to view the content of this file.

- **/var/log/user.log** – Contains information about all user level logs
- **/var/log/btmp** – This file contains information about failed login attempts. Use the last command to view the btmp file. For example, “last -f /var/log/btmp | more”
- **/var/log/yum.log** – Contains information that are logged when a package is installed using yum
- **/var/log/cron** – Whenever cron daemon (or anacron) starts a cron job, it logs the information about the cron job in this file

Example: sudo cat /var/log/auth.log

cbkpc@ubuntu:~\$ sudo tail -5 /var/log/auth.log

Jun 5 12:42:01 ubuntu CRON[8049]: pam_unix(cron:session): session closed for user cbkpc

Jun 5 12:43:01 ubuntu CRON[8066]: pam_unix(cron:session): session opened for user cbkpc(uid=1000) by (uid=0)

Jun 5 12:43:01 ubuntu CRON[8066]: pam_unix(cron:session): session closed for user cbkpc

Jun 5 12:43:40 ubuntu sudo: cbkpc : TTY=pts/0 ; PWD=/home/cbkpc ; USER=root ; COMMAND=/usr/bin/tail -10 /var/log/auth.log

Jun 5 12:43:40 ubuntu sudo: pam_unix(sudo:session): session opened for user root(uid=0) by (uid=1000)

cbkpc@ubuntu:~\$ sudo tail -5 /var/log/boot.log

[OK] Started Authorization Manager.

Starting Modem Manager...

[OK] Started Power Profiles daemon.

System maintenance commands:

Shutdown

- “**Shutdown**” refers to the process of stopping and shutting down a computer or server.
- **Standard command for shutting down Linux**
 - **shutdown -h**
 - Linux will shut down in under a minute. The “-h” option explicitly stands for the shutting down or powering off of a system.
 - **shutdown**
 - User can usually produce the same results by just entering the shutdown command on its own.
- **Standard command for restarting Linux**
 - **shutdown -r**
 - Linux will be restarted in under a minute.
 - The “-r” option stands for reboot or restart.
- **Command for shutting down Linux immediately**
 - **shutdown -h 0** // time Specification 0
 - **shutdown now**
 - Another common command for shutting down Linux immediately:
- **Command for restarting Linux immediately**
 - **shutdown -r 0** // time Specification 0
 - **shutdown -r now**
- **Command for Shutting Down/Restart Linux after 20 minutes**
 - **shutdown -h 20**
 - **shutdown +20**
 - **shutdown -r 20**
 - **shutdown -r +20**
 - **shutdown -h 17:30** // Shutting down at 5.30pm
 - **shutdown -r 17:30** // Restarting at 5.30pm

Rebooting

- Booting is **starting a computer's operating system**, so rebooting is to start it for a second or third time.
- **sudo reboot**
- **sudo systemctl reboot**
- **sudo shutdown -r**

halt

- This command in Linux is **used to instruct the hardware to stop all the CPU functions.**
- Basically, it reboots or stops the system.
- **halt [OPTION]**
- **Options used:**
 - -f, -force It does not invoke shutdown
 - -w, -wtm-only It will not call shutdown or the reboot system call but writes the shutdown record to /var/log/wtmp file.
 - -p, -poweroff To behave as poweroff

init

- **init** is parent of all Linux processes with PID or process ID of 1.
- It is the first process to start when a computer boots up and runs until the system shuts down.
- init stands for initialization. The role of init is to create processes from script stored in the file /etc/inittab which is a configuration file which is to be used by initialization system.
- Run Levels is the state of init where a group of processes are defined to start at the startup of OS. Each runlevel has a certain number of services stopped or started. Conventionally seven runlevels exist numbers from zero to six.

Run Level	Mode	Action
0	Halt	Shuts down system
1	Single-User Mode	Does not configure network interfaces, start daemons, or allow non-root logins
2	Multi-User Mode	Does not configure network interfaces or start daemons.
3	Multi-User Mode with Networking	Starts the system normally.
4	Undefined	Not used/User-definable
5	X11	As runlevel 3 + display manager(X)
6	Reboot	Reboots the system

System update & repositories

Update the Repositories

- **sudo apt-get update**
- This command refreshes local list of software, making a note of any newer revisions and updates.

Run the upgrade

- **sudo apt-get dist-upgrade**
- The “dist-upgrade” switch asks Ubuntu to handle any **dependencies** intelligently.

Packaging Manager

- Packaging manager is the software used for managing, installing, updating, upgrading etc. of the packages of a system.
- Linux based systems or Linux systems have a lot of such packaging managers in which two are: **yum** and **rpm**.

yum

- Yum and RPM are both package managers for Linux systems.
- Yum stands for Yellowdog Updater Modified. They are packaging managers for RPM-based Linux systems.
- Yum can only install the packages available in its repository.
- Yum can also scan and upgrade the packages to the latest versions. It also entirely relies on online repositories.

rpm

- RPM stands for Redhat Packaging Manager.
- It can be considered one of the oldest packaging managers that do basic functions like uninstalling, updating, archiving the packages received by the Linux systems.
- It can install multiple packages with the condition that we give the correct file name with the .rpm extension.
